## Summary

---

Full-stack product engineer specializing in TypeScript platforms, public APIs, admin workflows, permissions, and financial/reporting systems. Owns ambiguous product areas end-to-end across NestJS backends, React/Next.js frontends, mobile apps, and web3 infrastructure, with a track record of turning complex systems into reliable product capabilities. Pragmatic builder focused on maintainable architecture, operational correctness, and user-facing impact.

## Work Experience

---

### Software Engineer II    Overflow

Mar 2025 – Present

- Owned expansion of Overflow's public API platform across donor profiles, payment methods, contributions, campaigns, subscriptions, one-time charges, and API keys, enabling broader partner integrations while standardizing response shapes, DTOs, and permission checks
- Created reusable location-aware permission primitives across repositories, controllers, DTOs, and admin workflows, unlocking location-based roles and future multi-location product features
- Applied location scoping to dashboards, reports, exports, reconciliation, pledges, recurring gifts, donor flows, and gift entry, enabling location-based admins to filter operational and financial data correctly
- Shipped self-service admin workflows for locations, user management, roles, API keys, funds/subfunds, giving links, pledge campaigns, and developer settings, reducing reliance on internal support for nonprofit configuration
- Strengthened backend maintainability and reliability with CQRS handlers, domain events, sagas, queue-backed jobs, repository filtering, permission abstractions, tests, and type-safe DTOs across financial and admin workflows

### Software Engineer    Bunches, Inc.

Aug 2022 – Dec 2024

- Built and launched the Android app for a previously iOS-only product, integrating Capacitor push notifications, deep links, media, haptics, native sharing, and status bar behavior to enable 20,000+ new users to join
- Led frontend architecture for a mobile-first social app in a PNPM/Turborepo monorepo, building shared Next.js, React, Capacitor, Apollo GraphQL, Zustand, Phoenix channel, and TypeScript foundations
- Built real-time messaging infrastructure with Phoenix channels, typed listeners, pagination, optimistic updates, reactions, threads, and Zod validation, improving message ordering, speed, and multi-client sync accuracy
- Built client-side wallet and transaction infrastructure for non-custodial wallet generation, encrypted secure wallet backup, EIP-712 signing, recovered-address verification, SIWE messages, and token transfer parsing, expanding the wallet-backed experience to 250,000+ users
- Designed, implemented, and launched REP reputation/governance token infrastructure to real users using Solidity, Hardhat, OpenZeppelin upgradeable contracts, UUPS proxies, capped ERC-20 supply, role-based access control, and trusted-forwarder support

### Software Engineer Intern    Bunches, Inc.

Jun 2022 – Aug 2022

- Built a Web3 growth prototype as the solo engineer, delivering an end-to-end NFT creation flow spanning wallet connection, Web3 identity, visual customization, image generation, onchain minting, backend uploads, and sharing
- Integrated RainbowKit, wagmi, ethers, contract event listeners, gas estimation, DOM-to-image generation, and responsive React UI into a polished consumer minting experience

## Skills

---

**Languages:** TypeScript, JavaScript, Solidity

**Backend:** Node.js, NestJS, GraphQL, REST APIs, MongoDB, Queues

**Frontend:** React, Next.js, Tailwind, Apollo GraphQL, Zustand

**Mobile/Web3:** Capacitor, EIP-712, SIWE, Viem, Ethers.js, Hardhat

**Architecture:** CQRS, Domain Events, Permissions, System Design, CI/Linting
